Seagrass Predominance in FL Keys

Influences

Fish and Animal Diversity
Water Clarity
Oxygen Concentration

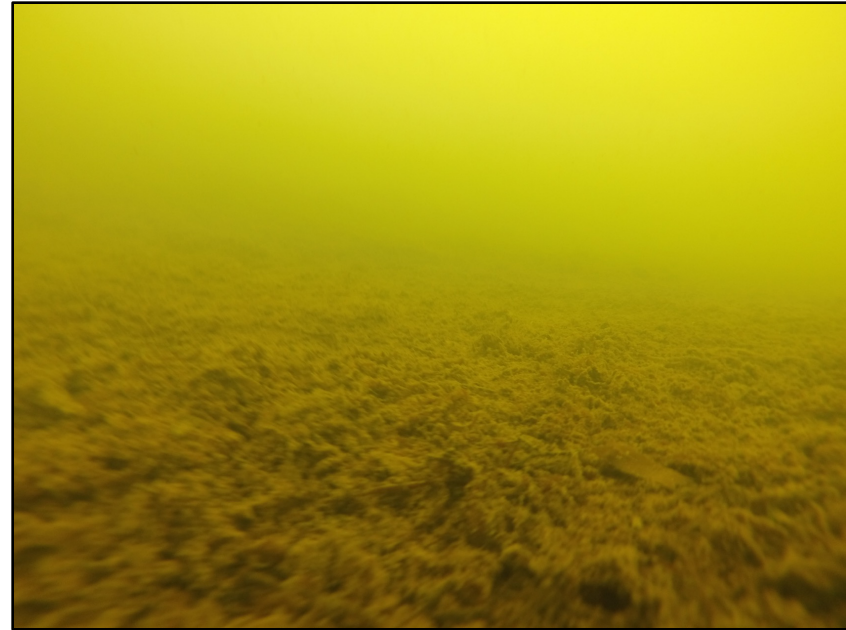

Controlled by

Light
Nutrients
Water Chemistry

The Reality of the Canals

50 meters outside canal

25 meters inside canal

Presentation Roadmap

What we monitor

- Seagrass and algae
- Fish and swimming animals
- Organisms on seawall
- Sediment characteristics

Where and when we sample

- Experimental Design
- Sampling Schedule

Baseline Data

- Seagrass/algae
- Animals
- Sea wall
- Sediment

Benthic cover

Quantifying species of seagrass, algae, sponges, corals using Braun-Blanquet scoring

- Standard
- Rapid
- Non-destructive

Scoring

Single Individ. = 0.1

<5 indiv. = 0.5

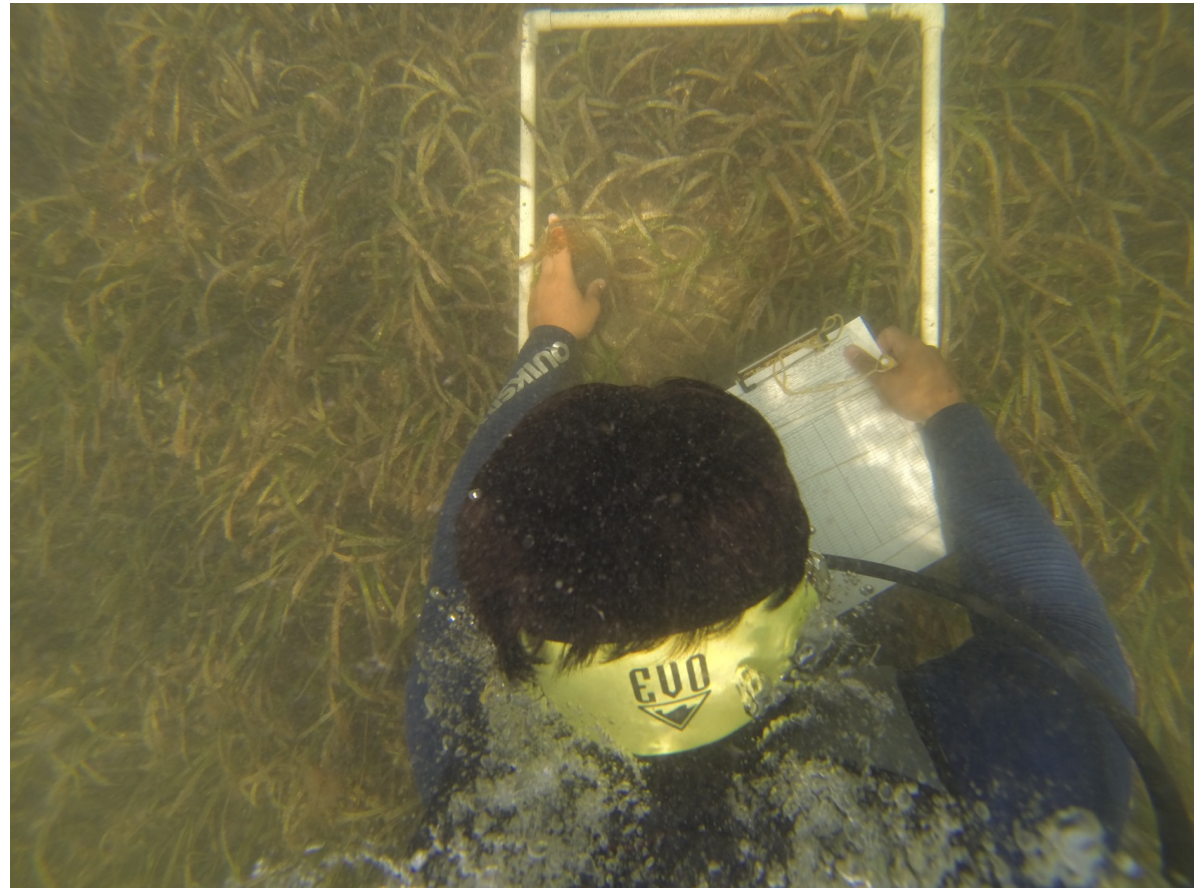

>5 indiv. and < 5% = 1

5 - 25% = 2

25 - 50% = 3

50 - 75% = 4

75 - 100% = 5

Animal Surveys

Animal surveys using the Roving Diver Technique
-diver swims freely around a central point

- Standard
- Rapid
- Non-destructive

All animal encounters
are recorded

Seawall

Quantifying organisms on canal seawall using a modified Braun-Blanquet technique

- Standard
- Rapid
- Non-destructive

Scoring

Single Individ. = 0.1

<5 indiv. = 0.5

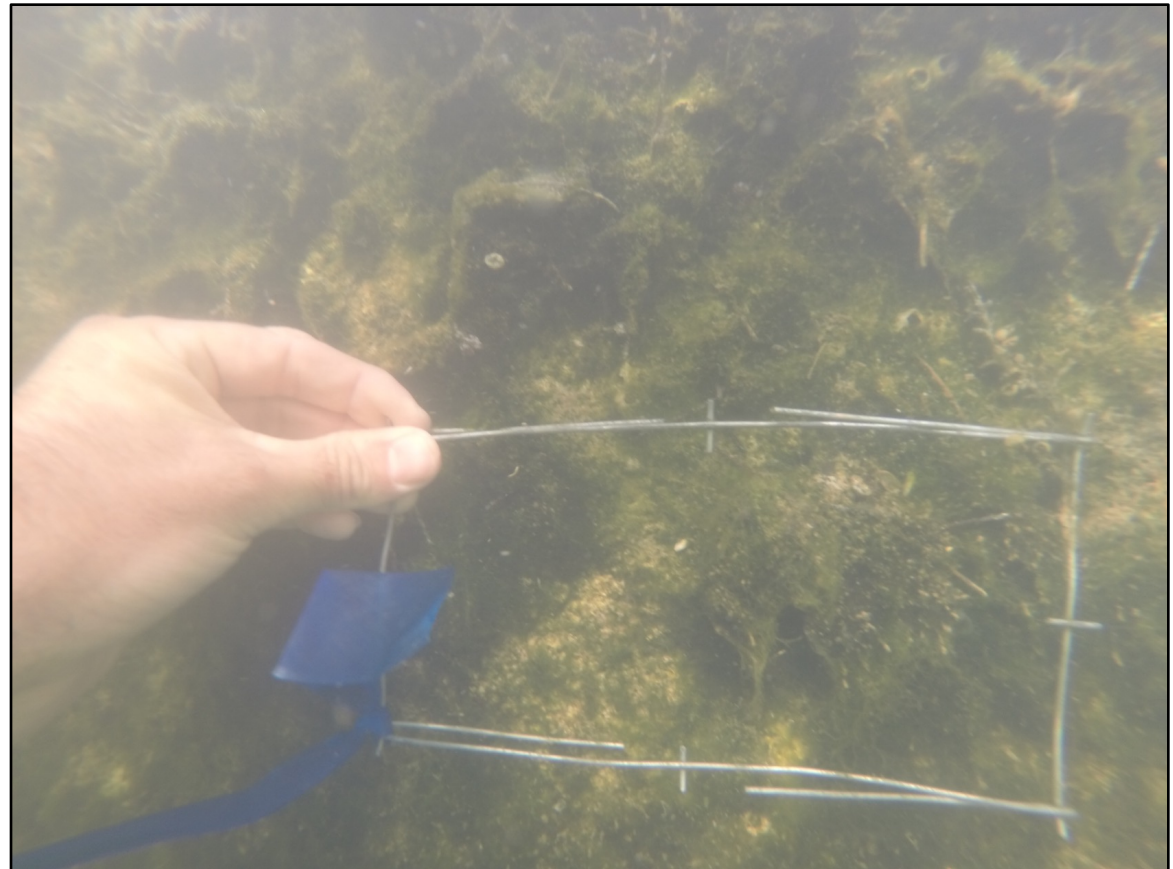

>5 indiv. and < 5% = 1

5 - 25% = 2

25 - 50% = 3

50 - 75% = 4

75 - 100% = 5

Sediment Characteristics

Tracking sediment depth and nutrient content in canals

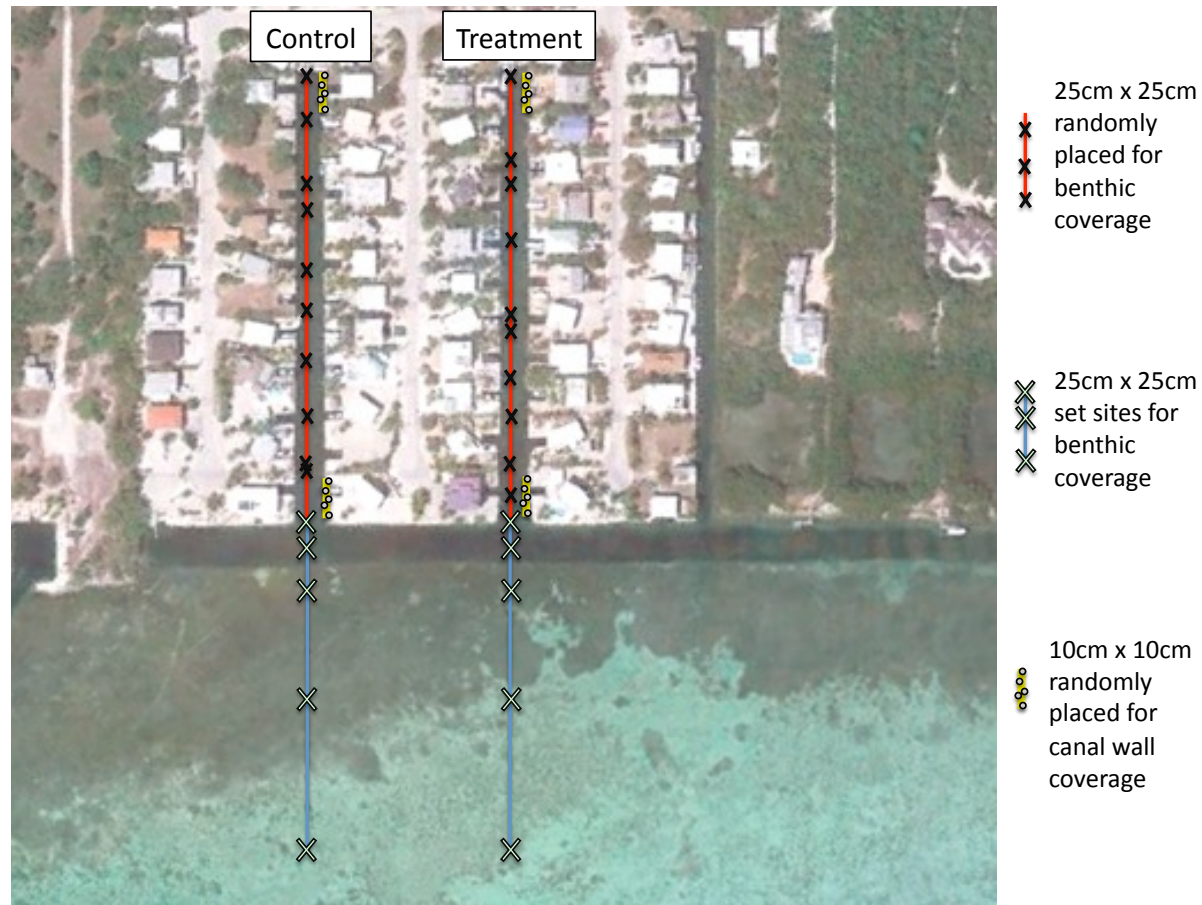

Sediment Depth
Sediment Density
% Organic Carbon
% Nitrogen
% Phosphorus

Isotopic Ratios of
Carbon and Nitrogen

Canal Sampling

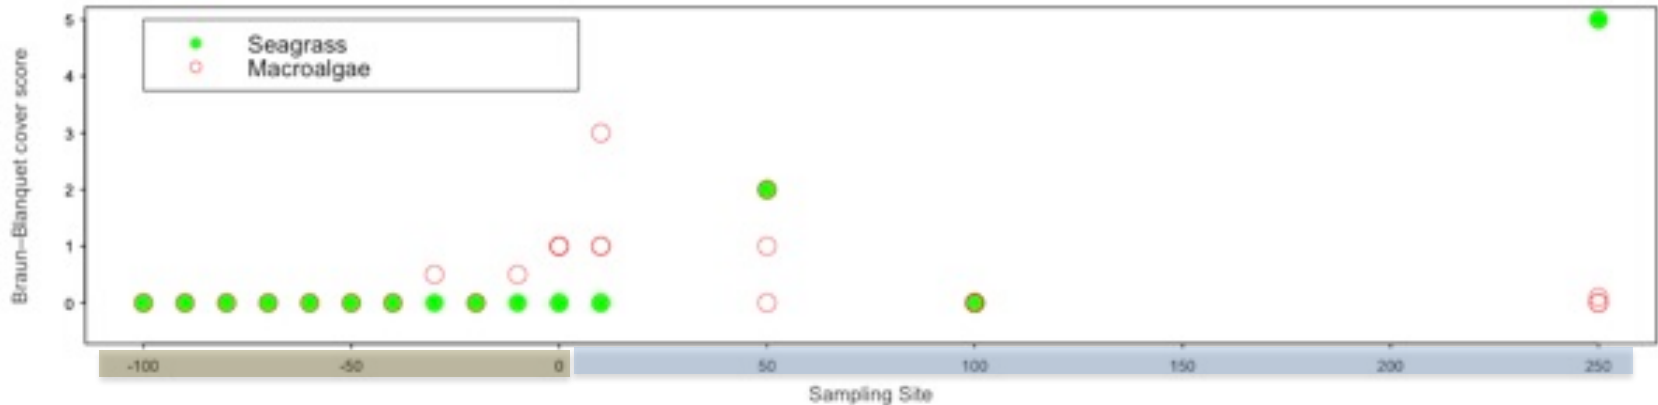

Nine experimental Pairs Five Technologies
Sampled 3 times/year

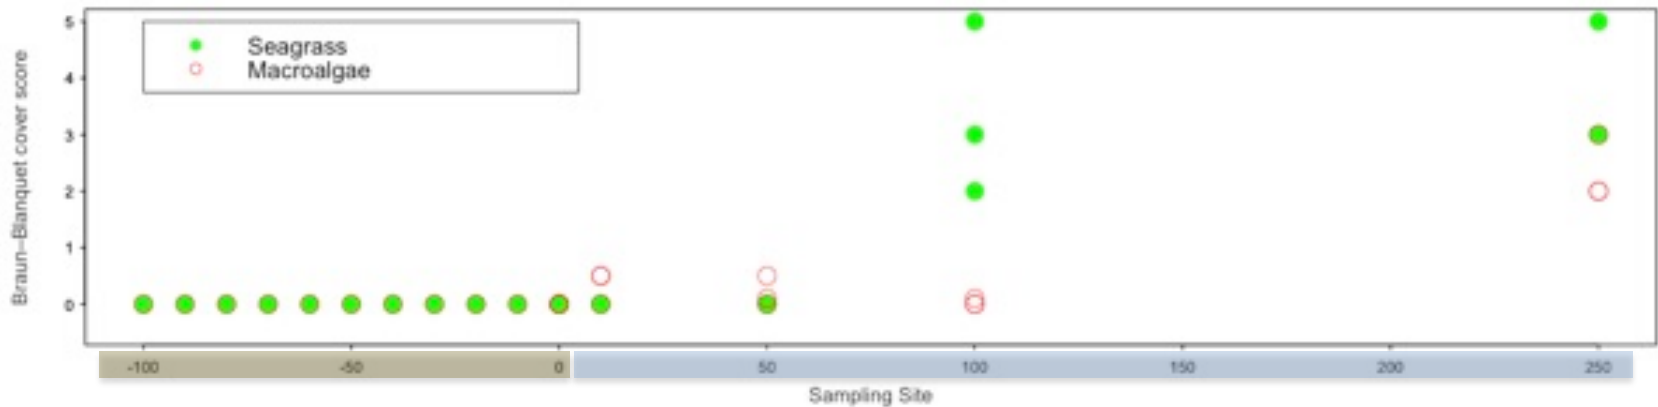

Results

Seagrass Coverage

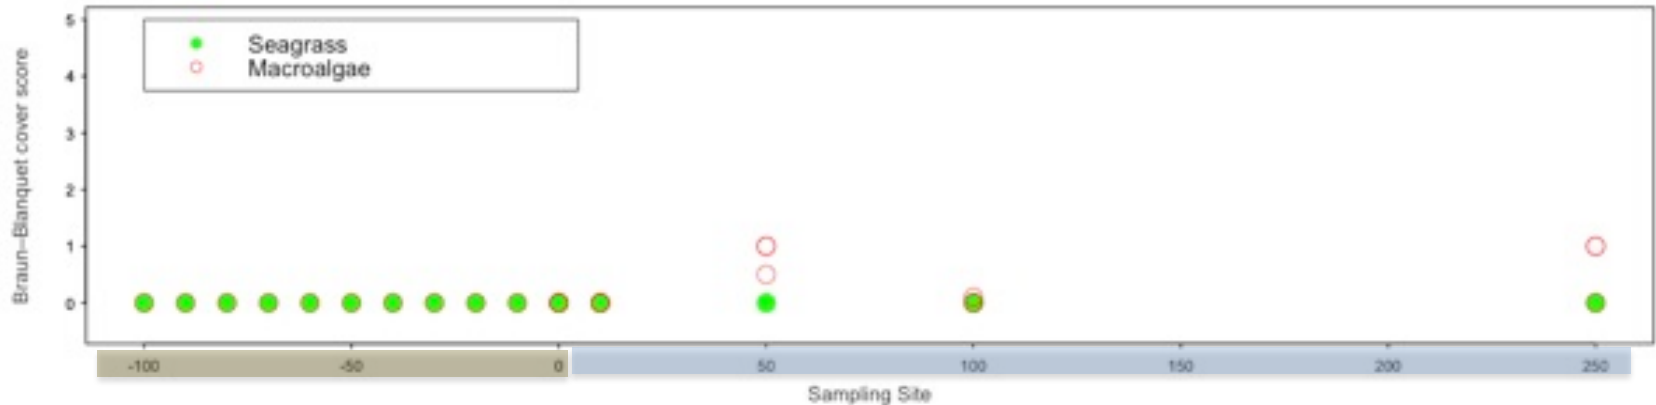

Canal 137 – Treasure Harbor
Plantation Key

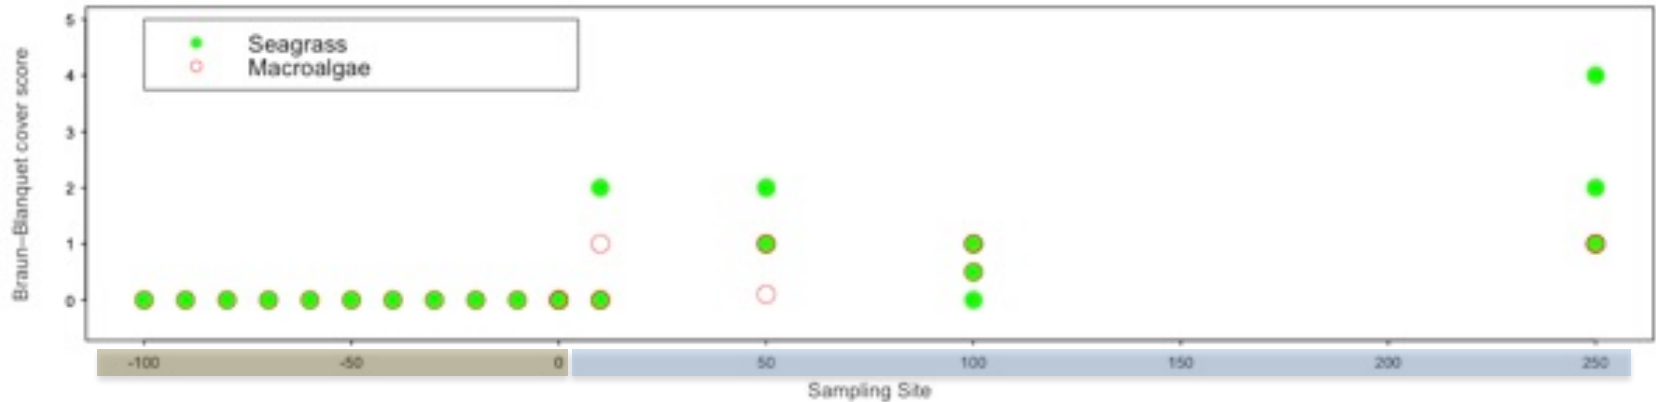

Canal 290 - Hollerich Subdivision
Big Pine

Seagrass Coverage

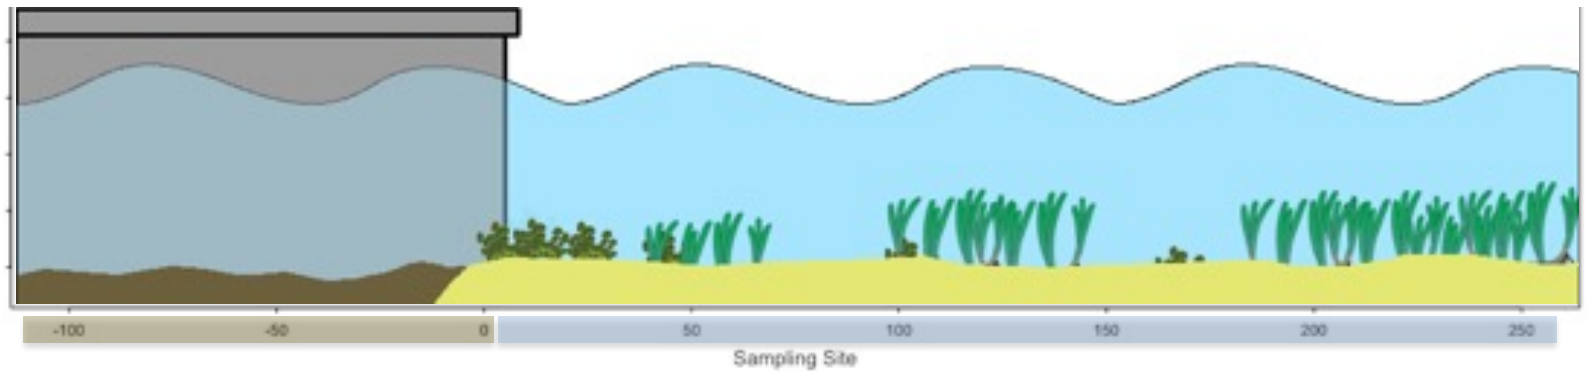

Canal 293– Between Avenue I and Avenue J
Big Pine

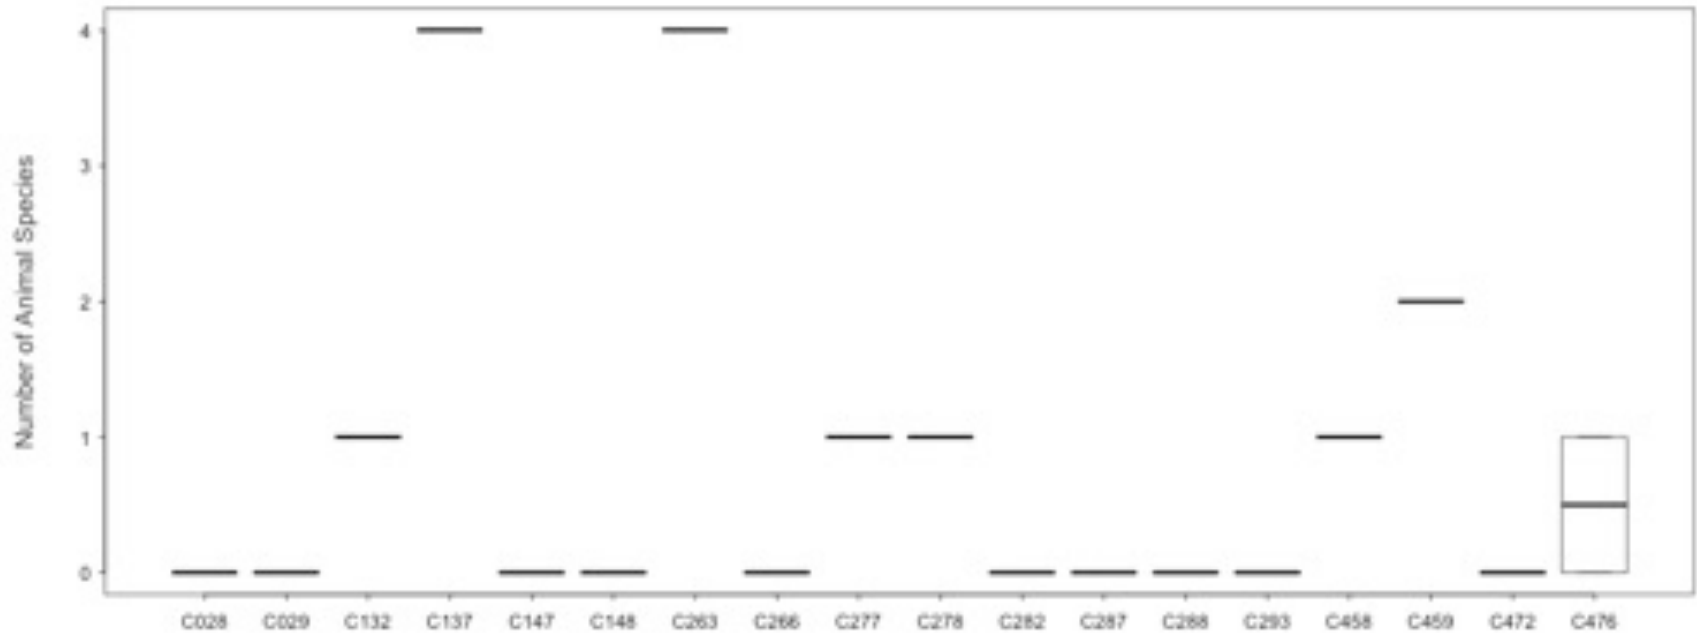

Canal 472- Geiger Mobile Homes Subdivision
Big Pine

Seagrass Coverage

Fish and other Animals

Species

Mangrove Snapper

Sardines

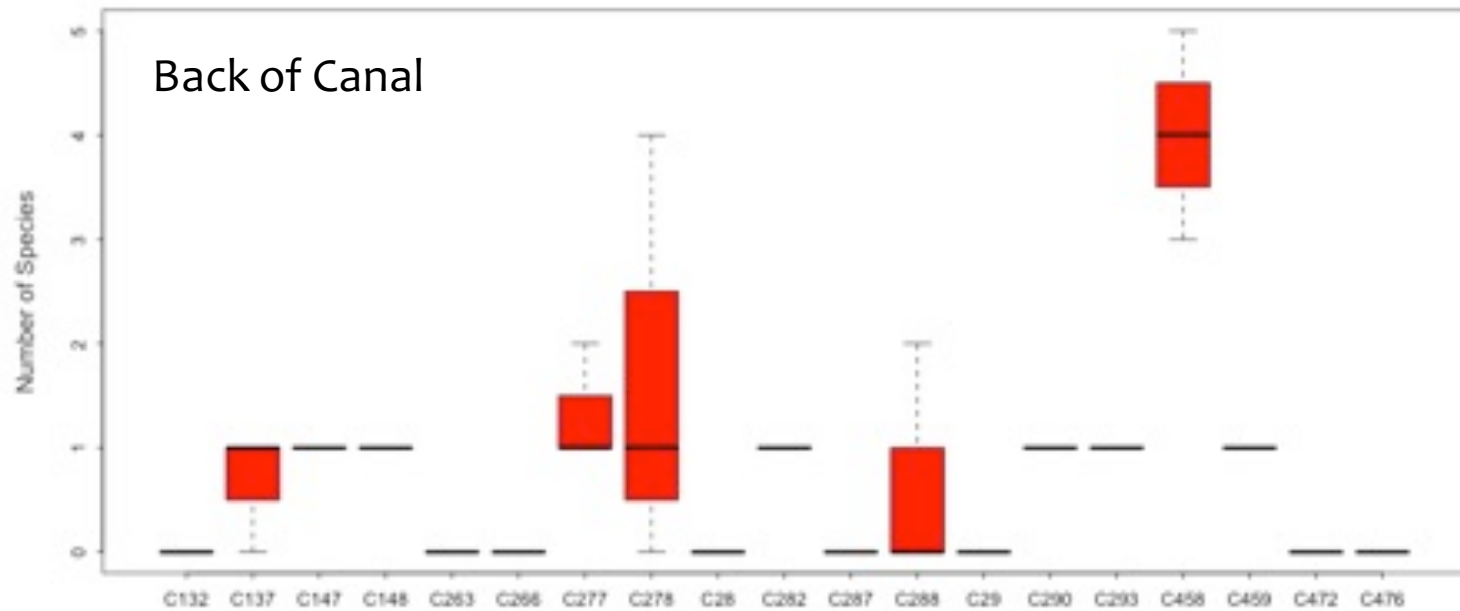

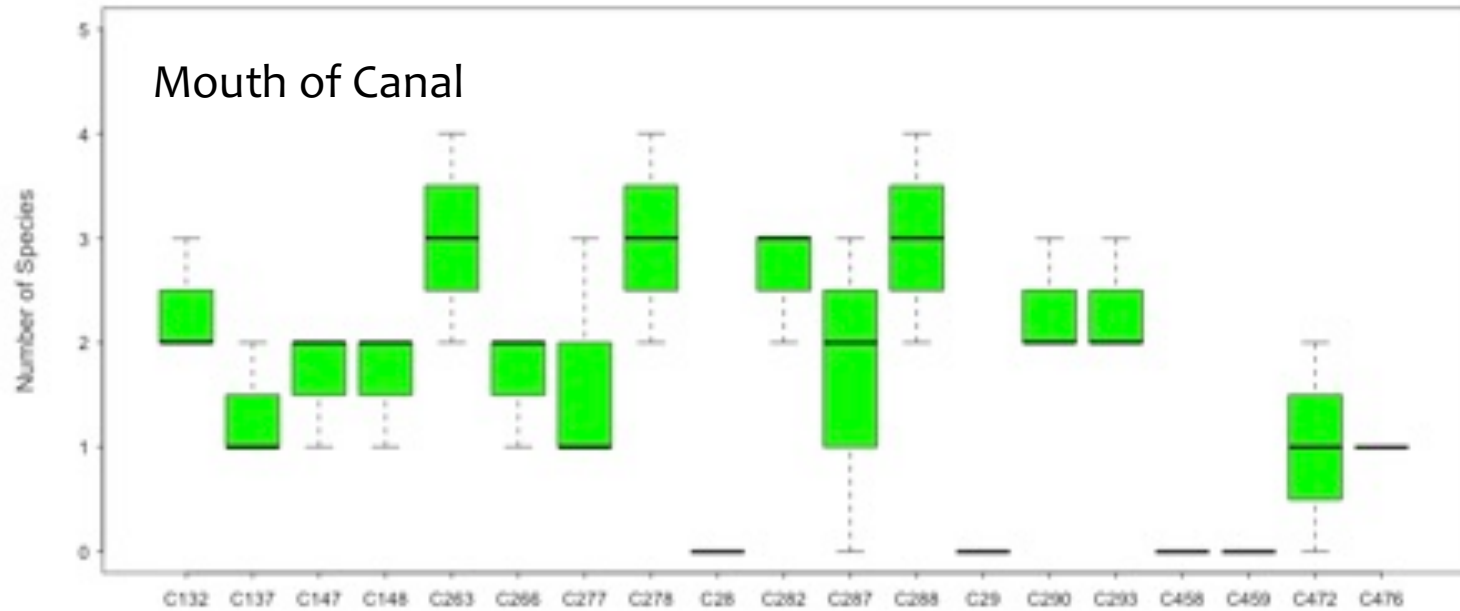

Sgt Major

French Grunt

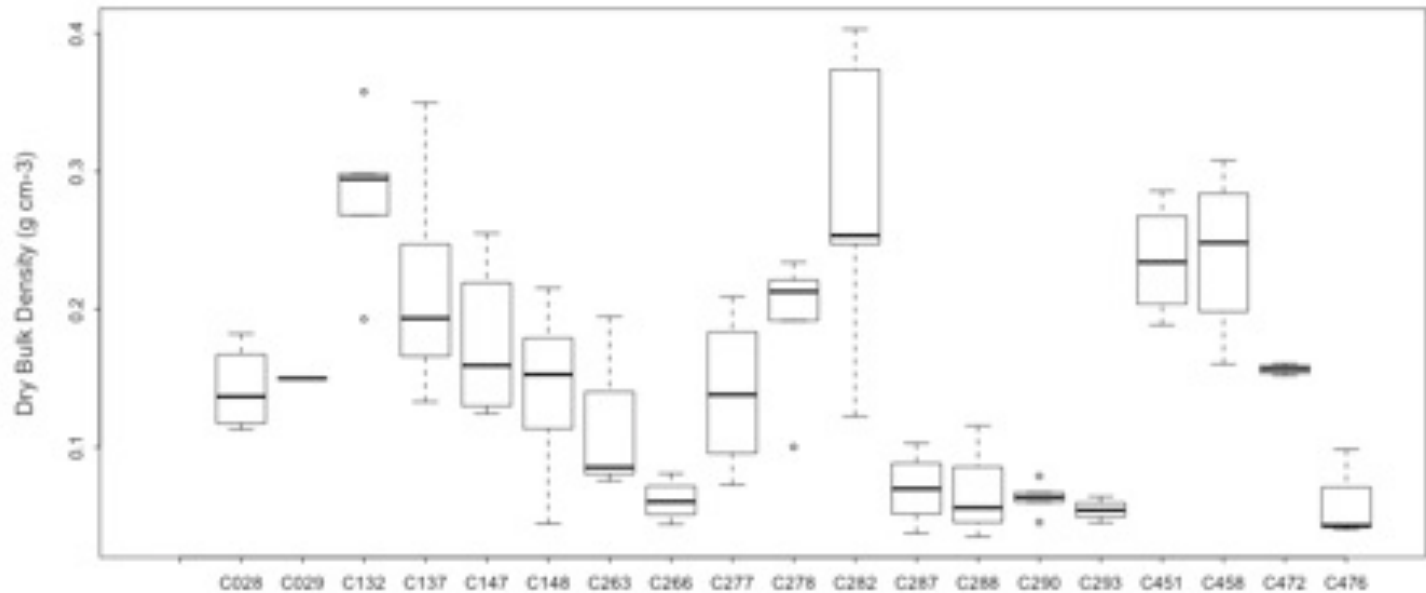

Barracuda

Manatee

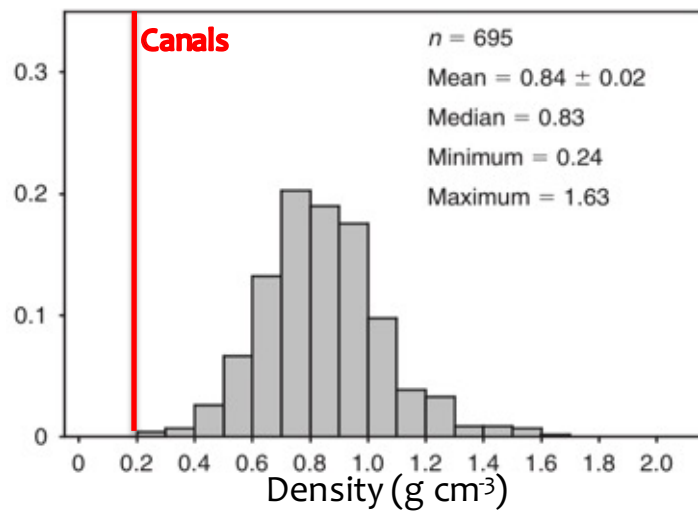

Seawall

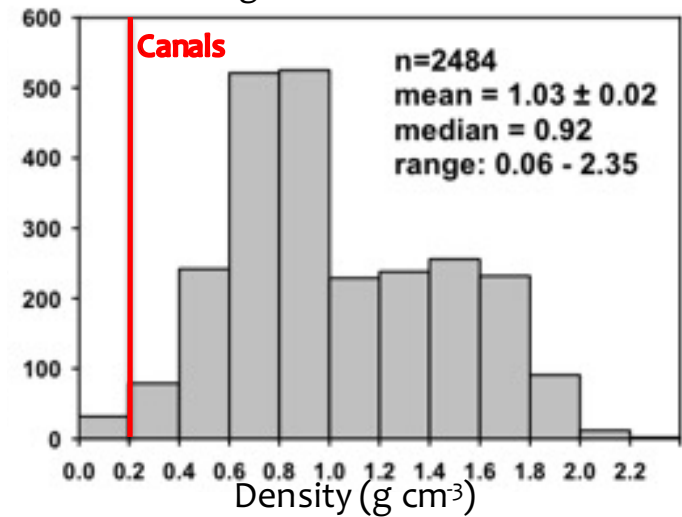

Sediment Density

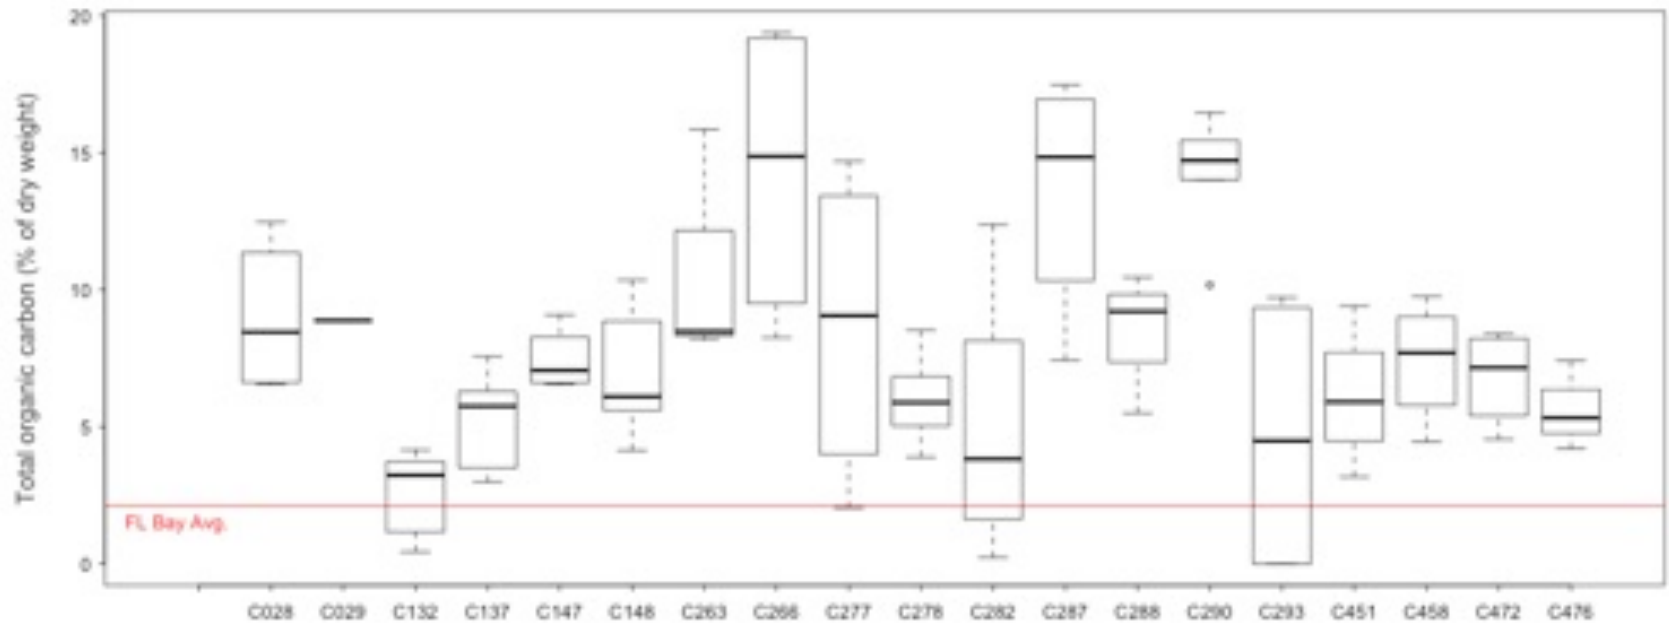

Florida Bay Seagrass Sediment

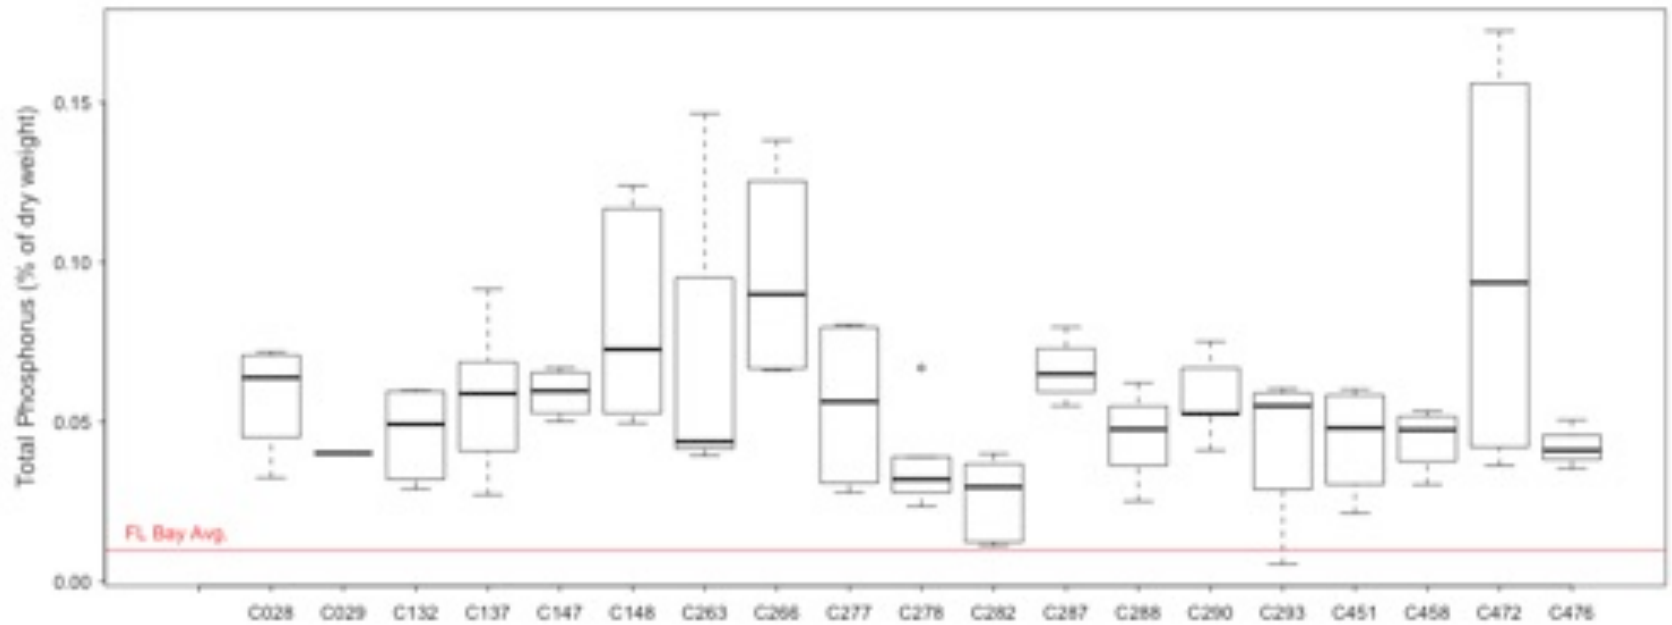

Global Seagrass Sediment

Sediment Organic Carbon

Sediment Phosphorus

Summary

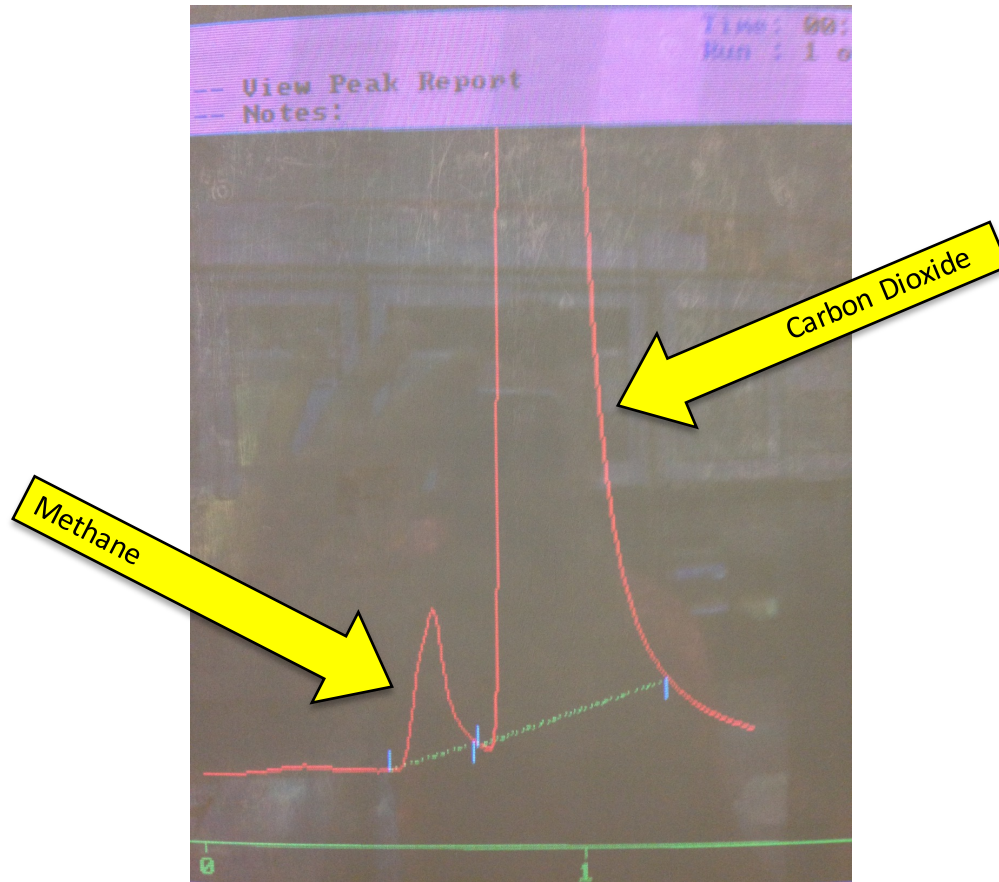

Canal sediment is: light
rich in organic material
rich in phosphorus
deep

Resulting in:
Lower animal diversity
Absence of benthic seagrasses
and algae
Low density on seawalls

Unique chemistry for scientists

Benthic Monitoring for the Florida Keys Canal Water Quality Remediation Project

Many residential canals in the Florida Keys are showing the typical symptoms of unhealthy, eutrophic water including anoxia, low water clarity, and increasing hydrogen sulfide that have resulted in waters unsuitable for swimming and much sea life. To address this issue, Monroe County, cities within the Florida Keys, the US-EPA, and even homeowner associations are helping to fund restoration efforts. The Seagrass Ecosystems Research Lab is proud to part of the first stage of this large-scale project where various remediation technologies will be experimentally installed to determine the most feasible option for larger-scale remediation efforts. This first stage will assess the effectiveness of the different technologies by comparing experimentally altered canals with nearby, unaltered controls over a period of three years. The effectiveness of remediation technologies will be determined by using organisms to indicate levels of canal health, including seagrass, macroalgae, and fish that are established proxies for water quality. We are also taking sediment samples to understand the source and composition of the accumulated organic material in the canal bottoms. Check out our work in the demonstration canals mapped below or visit the Monroe County's [website](#) on the project.

The map displays the Florida Keys, including Middle Torch Key, Big Pine Key, and No Name Key. It highlights several monitoring locations marked with red pins and green rectangles. Key roads shown include Key Center Blvd, South St, and Ave C. A legend in the top right corner indicates 'Map' and 'Satellite' views. A scale bar and a compass rose are also visible in the top left corner.

Map Satellite

Experimental Set - Org Removal

At this site, we will observe the effect of organic material removal on canal water quality and health. Canal 292 will be the experimental treatment, being dredged of organic material, while canal 293 will be the experimental control for reference.

Canal 290

Located between between Avenue I and Avenue J on the East Side of Big Pine, this experimental canal is scheduled to have the organic matter removal from the canal bottom

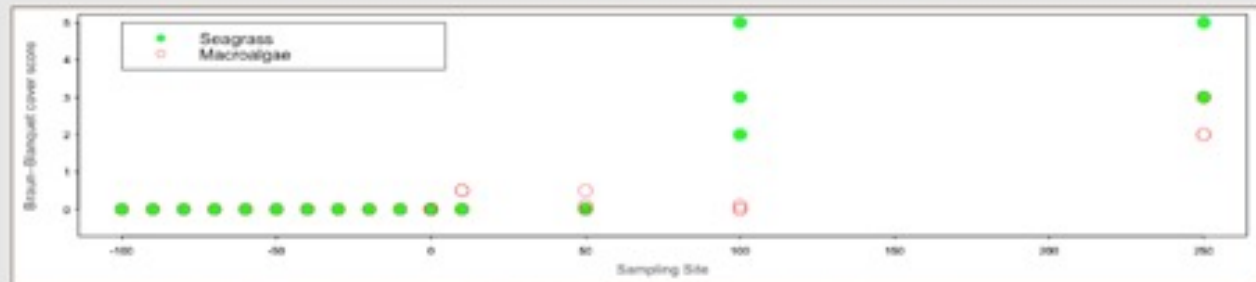

A satellite map view of Canal 290, showing a long, narrow waterway flanked by residential and commercial buildings. The map includes a Google logo in the bottom left corner and a 'Map' button in the top right corner. Below the map, there is a small rectangular image showing palm trees against a blue sky.

Canal Data on the Internet

Seagrass is abundant outside canal. There is NO living seagrass within canal 290.

Seagrass and Algae coverage from 250meters outside canal to the back. Note decreases of both at 100 meters outside
